

Kai

Developer & Technical Writer

fuddleyu@gmail.com | China, UTC+8 | Remote projects | Email / chat
luoy16002-svg.github.io/kai-works | [GitHub](#) / [source & tests](#)

I write code-led explanations about data validation, browser performance and failure recovery. Each topic starts with a runnable example and makes its limits explicit.

TECHNICAL SKILLS

Python, TypeScript, React, SQLite, data validation, CLI examples, automated tests, technical documentation, Git

SELECTED INDEPENDENT PROJECTS | 2026

Invoice Gate

Python / SQLite / Decimal / unittest | [Writing sample](#)

- Wrote a code-led article explaining invoice arithmetic, explicit number formats, retry handling and transactional SQLite imports.
- Built the companion Python CLI with 20 tests, including conflicting revisions, rollback and concurrent imports; no external packages required.

Current

React / TypeScript / Web Workers / SVG | [Case notes & evidence](#)

- Built a React CSV workspace with worker-based parsing and queries, a virtual table, cancellation and filtered export.
- Checked 100,000 synthetic records against an independent BigInt reference; browser export was verified with Python csv and Decimal.

PROOF

TypeScript / React / Node.js / deterministic simulation | [Case notes & evidence](#)

- Built a seeded agent evaluation simulator with bounded actions, final-state grading and replay verification of imported traces.
- Documented four public scenarios with six variants each, separating reference policies, recorded agent trials and justified handoffs.

WORKING ARRANGEMENT

Remote project work, with written briefs and review over email or chat. Open to a scoped paid trial. Agree scope, delivery date and payment terms before work starts.
